In my talk I will present the properties of a variety of Polish psych predicates in various contexts with particular focus on their nominalizations, which are of special interest in view of their diversity and productivity. I will compare them to similar constructions in other languages, particularly in Romance languages. The following issues will be addressed:

- What event types do psych verbs belong to?
- Are they telic?
- Are they change-of-state verbs?
- Are they states?
- Are they inchoative/inceptive?
- Do they form aspectual pairs?
- Do they describe complex or simple events and what their nominalizations can tell us about their event status?
